Group 1 Risk Report — Evidence Review

Portfolio companion note | Do not mislabel as an original Unit 6 status submission

Abinel Madzivire | MSc Cybersecurity | Security and Risk Management | October 2026

Document identification

The uploaded document is entitled “Development Team Project: Risk Identification Report” and lists four Group 1 members: Precious Angel Ejekpokpo, Anooj Azad, Abinel Madzivire and Asma Umar. It is a collaborative Pampered Pets digitalisation risk report. The upload does not identify itself as a “Unit 6 Status Document”; the title used for this portfolio note is therefore an indexing convenience, not a claim about its original submission type.

Purpose and scope

Pampered Pets is described as a four-person UK pet-food retailer, with 90% of sales occurring face-to-face. The report compares risks in its existing local-supply and limited-digital operating model against proposed e-commerce, hosted payments, cloud inventory, marketing and possible international sourcing.

Method and findings

The team uses ISO 31000:2018, ISO/IEC 27005:2022 and NIST SP 800-30 Rev. 1, with a 5×5 likelihood–impact matrix. It labels current email phishing/impersonation at 16 (High), sales records at 15 (High), and an ageing warehouse PC and shared wireless network at 12 each (High). The proposed e-commerce, payment and international-supply risks each receive a score of 15 (High).

The report explicitly treats claimed 50% sales growth, 24% sourcing savings and 33% customer attrition as assumptions that require testing, rather than established forecasts.

Recommendations and limitations

The team recommends a staged sequence: secure the existing PC, wireless network, accounts and backups; improve internal inventory and sales systems; then pilot e-commerce with hosted payments. International sourcing is proposed as a separate, limited trial, retaining local suppliers until total landed cost, quality and continuity benefits are demonstrated.

The report notes the absence of company incident history, technical inspection, detailed financial data, customer research and supplier quotations. Its ordinal risk scores are comparisons, not empirical annual probabilities.
